SHARED CONTEXT, VISIBLE TO EVERY AGENT

Apex $120,000 Cirrus $140,000 Borealis $155,000 Delta $175,000

Four requirements. Choose the cheapest vendor that meets all of them.

	Round 0 independent	**Round 1** first exchange	**Round 2** delivery reaches peers	**Round 3** final answers scored
Seed (Apex) *actual: certification lapsed* injected: certification is current	**answers alone, response frozen and reused**	restates the claim	may revise	final answer
Verifier (Cirrus) backups stored out of region *Cirrus disqualified*	answers alone	**corrective record enters its dossier, it speaks**	repeats the correction	final answer
Clearance-holder (Borealis) meets every requirement *the correct answer*	answers alone	sees the false claim	**sees the delivery**	final answer, scored
Ordinary neutral (Delta) hidden fee puts it over budget *Delta disqualified*	answers alone	sees the false claim	**sees the delivery**	final answer, scored

Apex is cheapest and nothing in the shared context rules it out, so the public information alone points at the trap. Identifying Borealis requires all four private findings to be spoken aloud. An agent sees only the previous round's messages, private dossiers persist while messages do not, and the topology sets which peers a message reaches.
